1.0 Introduction

The Digital Economy Act (DEA) (2017) provides the legal gateway for the linking and sharing of datasets held by public authorities for research purposes across the UK. The introduction of the DEA provides NISRA with a legal framework to access the data required to create the Earnings and Employees Study (EES) for research purposes.

The [Census of Population and Housing \(the Census\)](#) collects information every 10 years about people and households in Northern Ireland. It is used by central and local government, health authorities and many other organisations to plan and provide future services. The [Annual Survey of Hours and Earnings \(ASHE\)](#) is a UK wide survey that provides data on hourly, weekly and annual earnings by gender, work patterns, industry and occupation, including public versus private sector pay comparisons.

The ESS 2011 links together variables from the ASHE 2011 with variables from the Census 2011, and Capital Value data from the Land and Property Service. The dataset takes the form of one pre-linked table. The ASHE sample is comprised of 5,770 distinct ASHE records, approximately 1% of all employees in NI who were covered by Pay As You Earn (PAYE) schemes. These records are linked to 5,528 distinct Census records. The difference in the amount of distinct ASHE and distinct Census records is because several individuals within the dataset have more than one job.

The dataset is a standalone dataset and cannot be linked to other datasets. Additional variables cannot be added to the EES 2011 at this stage.

Access to the EES dataset is limited to researchers and research teams with [accredited researcher status](#) under the DEA and subject to approval by the UK Statistics Authority Research Accreditation Panel (RAP). Information on how to apply for approval is available [here](#).

This metadata document details the available variables within the dataset and their aggregations. It also includes a summary of the linkage methodology and the role of the Trusted Third Party (TTP).

For more information on how this dataset was created please contact NISRA's Research Support Unit: rsu@nisra.gov.uk

2.0 Areas of Research Interest

The EES 2011 has the potential to identify factors influencing variation in median pay for specific groups in society who are acknowledged as being disadvantaged in terms of the labour market. This includes, but is not limited to, differences in pay for gender, religion and disability and insight into the reasons for disparity in earnings between native workers and migrants. Other areas that may impact on pay and are of interest to policy include: occupation analysis; public versus private jobs; graduates in the workplace; geographic factors both in terms of place of work and area of residence and skilled occupations.

3.0 Linkage Report

The role of Trusted Third Party (TTP) involves linking together datasets using limited personal information (e.g. name, date of birth and postcode) provided by data suppliers for the purpose of a

specific ADR NI project. TTP use these links to provide the Research Support Unit (RSU) team in NISRA with an anonymous index of IDs which link between the datasets involved. The role of RSU is to bring together the attribute data using this index into a research dataset. TTP never have access to the attribute data. The following section details the work TTP have carried out to link 2011 Census data to 2011 ASHE.

3.1 Data sources

DATASET 1	
DATA SUPPLIER:	Economic and Labour Market Statistics Branch
DESCRIPTION:	Annual Survey of Hours and Earnings (ASHE) - a UK wide business survey that provides estimates on hourly, weekly and annual earnings for employee jobs. The ASHE is a 1% sample taken from the HM Revenue and Customs Pay as You Earn System.
NUMBER OF RECORDS:	5,770 records for 2011 5,528 individuals for 2011
PRE-MATCHING CHECKS	
<ol style="list-style-type: none"> 1. The ASHE has a very high response rate and there are no imputed records in the data. 2. Individuals selected for ASHE 2011 were eligible for matching. This data was supplemented with 2012-2018 ASHE data for those individuals selected for 2011 only, in order to maximise the response rate. 3. Information available to the TTP for linkage purposes: <ul style="list-style-type: none"> • Name information which includes surname, forename initial and mid-name initial, • Home and work postcode, • Sex and • Date of birth. 	

DATASET 2	
DATA SUPPLIER:	Census Office
DESCRIPTION:	Extract from the 2011 Census (entire enumerated population aged 16 and over including those both economically active and economically inactive)
NUMBER OF RECORDS:	1,365,124
PRE-MATCHING CHECKS	
<ol style="list-style-type: none"> 1. The data did not include those individuals who were imputed due to no response which accounted for 5% of the total population. <i>Match rates have not been adjusted for imputation as the data only included enumerated individuals.</i> 2. All 1,365,124 records contained enough data to enable them to be available for linkage. 3. Information available to the TTP for linkage purposes : <ul style="list-style-type: none"> • Name information which includes forename, mid-name and surname, • Address information at the time of the Census, • Sex and • Date of birth. 	

3.2 Linkage method

TTP use a 'rules based' or deterministic linkage approach using Match-Keys. Match-Keys are created by putting together pieces of information to create unique keys that can be used for automated linking e.g.

Dataset 1

ID	Forename	Surname	Sex	DOB	Postcode	Match-key 1: Forename, Surname, Sex, DOB, Postcode
1	John	Smith	M	01/01/1990	BT6 XXX	JOHNSMITHM01011990BT6XXX

Dataset 2

ID	Forename	Surname	Sex	DOB	Postcode	Match-key 1: Forename, Surname, Sex, DOB, Postcode
2	John	Smith	M	01/01/1990	BT6 XXX	JOHNSMITHM01011990BT6XXX

TTP choose to accept a link between record 1 in dataset 1 and record 2 in dataset 2 because match-key 1 is identical for both records. The variation in recording demographic information across datasets can occur in a number of different forms. A single match-key alone cannot resolve all of the differences that occur between data sources, hence the need for multiple Match-Keys. A series of Match-Keys have been developed, each of which is designed to resolve particular inconsistencies between match pairs. An example of a non-exact match-key is one constructed from the first two characters of an individual's forename and surname (Bi-grams), combined with their date of birth and postcode district. The strongest level of linking is exact linking, which links pairs of records that are identical on all linking fields. Typically, the Match-Keys are processed in a stepwise manner starting with the most exact match-key and working down to the last match-key.

3.3 Donor imputation

In order to produce a fully linked dataset, donor imputation work was carried out to link the remaining unmatched ASHE individuals to Census individuals with similar characteristics. This work followed the same deterministic linkage approach using Match-Keys as was used for the initial linkage. Match-Keys were created by putting together pieces of information to create unique keys that can be used for automated linking. Additional variables were provided for this work. The variables used to create the Match-Keys were:

- Occupation Code (coded using the 2010 Standard Occupational Classification System)
- Business Activity Code (coded using the UK Standard Industrial Classification of Economic Activities 2007 (SIC 2007))
- Gender
- Age
- Home Postcode
- Work Postcode

An iterative approach was used, beginning with matching on what were deemed to be tighter Match-Keys, and loosening the Match-Keys each time only accepting matches where there hasn't

already been a match through the tighter Match-Keys. Some example match-keys used for this process can be seen below:

Match-Key	Variables
1	3 digit SIC07, 4 digit SOC10, Gender, Age, Postcode Sector
2	2 digit SIC07, 4 digit SOC10, Gender, Age, Postcode Sector
3	3 digit SIC07, 4 digit SOC10, Gender, Age, Postcode District
4	2 digit SIC07, 4 digit SOC10, Gender, Age, Postcode District

This process resulted in individuals in the ASHE dataset being linked to a pool of potential donor records in the 2011 Census dataset. This pool of individuals had similar characteristics to those in the ASHE dataset. Once the unmatched ASHE records had been linked to a pool of potential donors within the Census data a random record was selected to be the match for that ASHE individual.

3.4 Resulting match

The resulting match was of high coverage and accuracy.

	Unadjusted match rate	Accuracy
ASHE 2011 to Census 2011	88.7%	100%

The research dataset contains a fully linked data set of 5,528 ASHE individuals or 5,770 ASHE records as a small number of individuals have more than one job.

4.0 Quality Assurance

Quality assurance practices were applied by the Research Support Unit (RSU) to the EES 2011 dataset to ensure the data was accurate, reliable, and representative. The quality assurance work also includes a statistical disclosure control assessment.

After the ASHE and Census files were linked the dataset was examined to ensure accuracy and reliability. For the ASHE variables in the EES 2011, RSU used the headline figures published in the ASHE 2011 Statistics Bulletin for comparison purposes. Similarly, for the Census variables in the EES 2011, RSU used the Census 2011 key statistics summary report, NINIS, and the Northern Ireland Longitudinal Study (NILS). Quality Assurance checks fell under the following headings:

4.1 Consistency within the data

RSU checked the data for anomalies, unexpected values, and issues with aggregations. Where issues were identified these were relayed to the data providers, and amended based on the advice received.

4.2 Consistency with published reports

RSU sought to replicate the [headline](#) statistics for hourly, weekly and annual earnings published in the ASHE 2011 Statistics Bulletin. Using STATA Version 17, the median and mean were calculated for each of the 11 headline figures using the appropriate filters and weights as detailed in the [ASHE Dataset Notes](#). See notes to tables in Annex A for more information.

As the EES 2011 is comprised of the full ASHE dataset (a 1% of all employees in NI who were covered by Pay As You Earn (PAYE) schemes) any inconsistency with the published ASHE report was minor, and fully explicable by the presence of donor records, the software used for the calculations, and the application of weighting. As such, RSU noted that the Earnings and Employees dataset was both consistent with and representational of the ASHE sample (as per the [2011 ASHE Stats Bulletin](#) and revised statistics within the [2012 ASHE Stats Bulletin](#)). See Annex A for more information.

RSU employed a similar method to determine representativeness within the Census data. Using STATA version 17, unweighted frequency distributions were calculated for each of the Person and Household variables. To check for consistency with published Census 2011 data for the Person variables, RSU compared the EES figures with the [Census 2011 summary report](#) and tables published in NINIS. Bespoke frequencies were calculated based on a demographic profile that best matched that of the EES (economically active (excluding self-employed and unemployed) and aged 16-74 years (where available)). Some published categories were collapsed to match those in the EES variables. For the Household variables, RSU used the NILS Census 2011 data, sampling the household of NILS members who were both economically active (excluding self-employed and unemployed) and aged 16-74 years, with variable categories collapsed to match those in the EES. See notes to tables in Annex B for more information.

Once again, RSU noted that the linked dataset was consistent with and representational of the whole population. Where there were discrepancies between the Census 2011/NILS-Members 2011 and the Earnings and Employees sample distributions, this was due to bespoke aggregation of variables by Census or the unavailability of a published figures for a similar sample for comparison. See Annex B for more information.

RSU would be happy to provide researchers with the code used to produce the ASHE frequencies above should they wish to replicate the analysis.

4.3 Statistical Disclosure Control (SDC)

RSU worked with the data providers to ensure that the data provided was safe and that it could not be used to disclose small numbers. For instance, most Census variables were aggregated and top-coded prior to linkage. After linkage, the SDC Unit applied the standard methodology used within the RSU to scrutinise the EES 2011 further.

Where risk was deemed too high, then the SDC Unit recommended applying further disclosure control methods. Due to risks of identification attached to the Sic07 and Occ10 variables, the SDC Unit recommended that restrictions be placed upon the release of those variables. The 1 / 2 digit codes for Sic07 and Occ10 will be the default variables available. Detailed Sic07 and Occ10 codes will not be allowed in conjunction with LGD2014Home.

Additionally, the detailed Sic07_4_cat, Sic07_5_cat and Occ10_4_cat codes will not be available to those accessing EES data outside of the RSU secure room i.e. via the ONS SRS facility. A rules-based approach to SDC will be applied to the clearing of all EES outputs.

4.4 Weighting and donor records comparison

RSU ran frequencies and cross tabulations with and without weighting applied. All variations between these outputs were documented. Information can be provided to researchers (on request) on the impact that weighting has when using different statistical packages. Approximately 10% of the records were donor. No donor flag is included in the dataset and thus donor records will not be made known to the researchers or RSU.

5.0 Weight Variables

The use of weights within survey data is important to help ensure that the data is representative of the overall population. Users should note that the EES dataset includes weight variables, which have been calculated and used in the production of the ASHE published tables. When replicating the published ASHE figures it is important that the correct weight is used, the most frequently used weighting variable is 'calweight'. It is also important to include the correct filters. Below is an example of the use of weights and filters to calculate summary figures for weekly pay-gross using STATA code.

```
summarize gpay [aweight = calwght] if (adr==1 & lop==2 & age>15), detail.
```

For more information on weights and filters please refer to the [ASHE dataset notes](#).

6.0 Metadata for ASHE

Table Name:	Earnings and Employees 2011
Data Description:	Economic and Labour Market Statistics Branch (ELMS) is part of the NISRA. The branch produces Business, Economic and Labour Market and Statistics in line with the Code of Practice for Official Statistics to monitor the performance of the Northern Ireland Economy and Labour Market. The data in ELMS includes the Northern Ireland Annual Survey of Hours and Earnings (ASHE) survey. ASHE provides information about the levels, distribution and make-up of earnings and hours paid for employees by gender and work pattern (full-time and part-time) ELMS quality report .
Source of the Data:	Economic and Labour Market Statistics Branch
Number of Records:	5,770
Currency of the Data:	Static: 2011 download

Users are advised to consult the published [ASHE Dataset Notes](#) for an ASHE data dictionary and description of the variables.

Sex	Colag	He	Stratum

Annex B – Census comparisons

The following are a selection of tables that compare the unweighted headline figures and proportions of the Census variables within the Earnings and Employees linked dataset to the Census 2011 summary report, NINIS, and the NILS. These tables provide evidence that the Earnings and Employees dataset is accurate and representative of the full sample population.

Note that percentages have been rounded to one decimal place and as a result may not sum to 100.
